

Swing Factors – 20 April 2026

Swing pricing is a process designed to protect the existing shareholders' interests in a sub-fund from costs incurred when other shareholders invest or divest in that sub-fund. These costs can include amongst others brokerage fees, foreign exchange costs, spreads and fiscal charges and, could negatively impact the fund's performance. To prevent this effect for the existing shareholders, the net asset value (NAV) per share class will be adjusted up or down by the swing factor charged to investing or divesting shareholders.

When the net movements of the sub-fund result in a higher number of shares, the adjustment will be an addition (swing factor up). When the net movements of the sub-fund result in a lower number of shares, the adjustment will be a deduction (swing factor down). A threshold is currently not applied (when the swing factor up or down is higher than a pre-determined percentage of the fund size).

The current swing factors can be found below. The swing factor may be adjusted in case of large subscriptions, redemptions or extreme market conditions, to cover additional costs.

Lightrock Global Small-Cap Fund

Share Class	ISIN	Up	Down	Threshold
